NOTE: This is a 'working draft' sequence. It currently consists of 80 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the flnished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Direct Submission

neurogenins, a novel family of atonal-related bHiH transcription
factors, are putative mammalian neuronal determination genes that
reveal progenitor cell heterogeneity in the developing CNS and PNS
Mol. Cell. Neurosci. 8 (4), 221-241 (1996)

                                                                                                                                                                                                         Mapping information for this clone was provided by Dr. John D. McPherson, Department of Genetics, Washington University, St. Louis MO. For additional information about the map position of this sequence, see http://genome.wustl.edu/gsc.
                                                  This sequence was finished as follows unless otherwise noted: all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e., phred quality >-30); an attempt was made to resolve all sequencing problems, such as compressions and repeats, all regions were covered by sequence from more than one subclone; and the assembly was confirmed by
                                                                                                                                                                                                                                                                                                             The RPCI-11 human BAC library was made from the blood of one male donor, as described by Oscegawa. X., Woon, P.Y., Zhao, B., Frengen, E. Tateno, M., Catanese, J.J. and de Jong, P.J. (1998) An improved approach for construction of bacterial artificial chromosome libraries. Genomics 51:1-8 "The Clone may be obtained either from Research Genetics, Inc. (http://www.resgen.com) or Pleter de Jong and coworkers at http://www.chori.org
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The clone sequenced to the left is AC004049, 2000 bp overlap; the clone sequenced to the right is RP11-148B6. Actual end of this clone is at base position 179697 of RP11-402J6.
clone sections once, or longer because we provide a small overlap between neighboring data submissions.

Direct Submission
Submitted (12-JUL-2001) Sanger Centre, Hinxton, Cambridgeshire,
CB10 1SA, UK. E-mail enquiries: humquery@sanger.ac.uk Clone
requests: clonerequest@sanger.ac.uk
On Jul 8, 2001 this sequence version replaced gi:14575291
During sequence assembly data is compared from overlapping clones.
Where differences are found these are annotated as variations
together with a note of the overlapping clone name. Note that the
variation annotation may not be found in the sequence submission
corresponding to the overlapping clone, as we submit sequences with
This sequence was finished as follows unless otherwise noted: all
                                                                                                                                                                                                                                                                                                                                                                                                                                            assembly was confirmed by restriction digest. The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases: Em:, EMBL; Sw:, SWISSPROT; Tr:, TREMEL; WORNPEP; Information on the WORNPEP database can be found at
                                                                                                                                                                                                                                                                                  This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >- 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Mapping Group. Further information can be found at http://www.sanger.ac.uk/HGP/Chrl0
RPI1-34331 is from the library RPCI-11.2 constructed by the group of Pieter de Jong. For further details see http://www.chori.org/Dacpac/home.htm

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            NOTE: This is a 'working draft' sequence. It currently consists of 24 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary, daps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Insert size: 176000; agarose-fp

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                    9
                                                                                                         The present sequence encodes a basic helix-loop-helix (BHLH) type protein, designated RELAX (Rat Embryonic Longitudinal Axis) protein. The protein is used to control and participate in gene expression, by acting as transcriptional activator, strictly dependent on the presence of an intact E box (CANNTG), particularly for targeting expression of proteins to the central nervous system (CNS). The nucleic acid sequence can be used to treat nervous system disorders, and antisense sequences can be used to control mRNA transcription.

The patent discloses a method for inducing non-neuronal cells (NNC) to differentiate into neurons and for NNCs to express a neuronal subtype specific marker. Transformed host cells are used as sources of neuronal and other growth factors; in culture for screening compounds that modulate neural differentiation or as sources of recombinantly produced methodate neural differentiation cas sources of recombinantly produced to neuropanis and Phox2a proteins for use in transplantation. The cells also have a variety of in vivo uses, e.g. for transplantation at sites of neuronal dystunction e.g. patients with hearing or vision loss due to optical or auditory nerve damage, brain or spinal cord injuries, and neurodespenerative disorders e.g. Alzheimer's disease. The present sequence encodes murine neurogenin 3 (NGN 3), a transcription factor that induces a core program of neurogenesis. Forced expression of murine NGN3 can elicit expression of at least some neuronal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Atonal; homologue; orthologue; atonal-associated protein; deafness; hearing impairment; vestibular effect; balance disorder; osteoarthritis; cellular proliferation; cerebellar granule neuron; gene therapy; mechanoreceptive cell growth; auditory; osteopathic; cytostatic;
                                                                                                                                                                                                                     Inducing non-neuronal cells to differentiate into neurons and for non-neuronal cells to express a neuronal subtype-specific marker, comprising contacting the non-neuronal cells with a vector containing neurogenin nucleic acid -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            762 GCGCTGGATGCGCTGCGCGGTGTCCTGCCCACCTTCCCGGATGACGCCAAACTTACAAAG 821

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Phox2a protein; neuronal subtype-specific marker; growth factor; neural differentiation; transplantation; neuronal dysfunction; optical nerve damage; neurodegenerative disorder; neuroperective; nootropic; anticonvulsant; antiparkinsonian; vulnerary; cerebroprotective; immunesuppressant; antilnfectious; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        neurogenin 3 is one of several neurogenin proteins discussed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            in the present invention. The neurogenin nucleic acids can be express in a host cell, transformed using an expression vector, to produce recombinant proteins. The proteins and the antibodies raised against the proteins are useful in the study of neurogenesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               762 GCGCTGGATGCGCTGCGCGGTGTCCTGCCCACCTTCCCGGATGACGCCAAACTTACAAAG 821

The invention relates to the use of atonal-associated nucleic acid or amino acid sequence, or any of its homologues or orthologues as therapeutic agents for the treatment of deafness, partial hearing loss, vestibular effects due to damage or loss of inner hair cells, osteoarthritis and abnormal cell proliferation. The invention also encompasses methods of screening for compounds which affect the expression of an atonal-associated nucleic acid sequence in an animal, cand a transgenic animal in which an allele of a native atonal-associated and a transgenic animal in which an allele of a native atonal-associated in activating the atonal-associated allele. The nucleic acids or proteins inactivating the atonal-associated allele. The nucleic acids or proteins may be used in a method of treating an animal for hearing impairment, of joint disease, balance disorders, abnormal cell proliferation, or other classes related to loss of a functional aconal-associated nucleic acid or protein. The may may particularly be used to treat an animal with a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               also be used in promoting mechanoreceptive cell growth and generating hair cells. The present sequence represents an atonal-associated nucleic acid sequence referred to in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 or their precursors, and may

The human neurogenin 3 Ngn3 DNA sequence AAC61089 encodes the Ngn3 protein AAY85617. The Ngn3 gene is located at chromosome position 10q22.1-22. The invention relates to the human Ngn3 nucleotide and 10q22.1-22. The invention relates to the human Ngn3 nucleotide and protein sequences, and includes an antibody recognising the Ngn3 protein. Also included in the invention is a method for identifying an islet cell precursor. The method involves analysing a cell for the expression of the Ngn3 gene product, where detection of the product is indicative of an islet cell precursor. The Ngn3 DNA sequence is useful as a diagnostic reagent for detecting (in a subject) a predisposition to a defect in Ngn3 activity. The Ngn3 protein is useful for identifying beta-cell precursor cells expressing Ngn3, and to alter cellular differentiation in outline in vivo to produce new beta-cells to treat patients with diabetes mellitus. The present sequence represents the murine Ngn3 genomic DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Atonal; homologue; orthologue; atonal-associated protein; deafness; hearing impairment; vestibular effect; balance disorder; osteoarthritis; cellular proliferation; cerebellar granule neuron; gene therapy; mechanoreceptive cell growth; auditory; osteopathic; cytostatic;

The present invention describes oligonucleotide libraries for detecting messenger RNAs that populate a (sub.)transcriptome where the (sub.)transcription comprises messenger RNAs transcribed from multiple transcription units that populate a genome. The library comprises c transcription units that populate a genome. The library comprises several oligonucleotides, each capable of hybridising selectively to a several oligonucleotide libraries are useful for detecting mult of the oligonucleotide libraries are useful for detecting mRNAs from a complex in expression profiling studies, in qualitatively or detecting RNA transcripts and splice variants of human or animal cranscriptomes. The libraries may also be used as specialised mind libraries to detect transcripts of a sub-transcriptome under a particular biological or pathology-specific genes such as those genes conly expressed in specific tissue under a specific pathological conly expressed in specific tissue under a specific pathological condition; to detect developmental specific genes such as those genes conly expressed in specific under a specific pathological condition; to detect developmental specific genes such as those genes condition; to detect developmental specific genes such as those genes conjugated and splice variants of a transcriptome of a patient suffering from a patricular disorder. ABNA7253 to ABNA7589 represent conficient of the printed of the present invention. Or the exemplification of the present invention form part of the printed specification of the present invention or such as obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                           New oligonucleotide libraries comprising oligonucleotides which selectively hybridize to mRNAs transcribed from a transcription unit of a genome, useful for detecting tissue-, pathology-, and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     anino acid sequence, or any of its homologues or orthologues as the interpretatic agents for the treatment of deafness, partial hearing loss, vestibular effects due to damage or loss of inner hair cells, osteoarthritis and abnormal cell proliferation. The invention also encompasses methods of screening for compounds which affect the capression of an atonal-associated nucleic caid sequence in an animal, and a transgenic animal in which an allele of a native atonal-associated allele. The nucleic acids or proteins may be used in a method of treating an animal for hearing impairment, joint disease, balance disorders, abnormal cell proliferation, or other of assase related to loss of a functional aconal-associated nucleic acids or protein. They may particularly be used to treat an animal with a deficiency in cerebellar granule neurons or their precursors, and may also be used in promotting mechanoreceptive cell growth and generating that cells. The present sequence represents an atonal-associated nucleic acid or acid sequence referred to los the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The oligonucleotide libraries are useful for detecting manage from a biological sample, in expression profiling studies, in qualitatively characterising the corresponding transcriptome, and in qualitatively characterising the corresponding transcriptome, and in factoring RNA transcripts and splice variants of human or animal transcriptomes. The libraries may also be used as specialised minimaries to detect transcripts of a sub-transcriptome under a particular biological or pathology specific genes such as those genes only expressed in specific tissue under a specific pathological conjugation of tissue- and pathology specific genes; and to detect RNA transcripts and splice variants of a transcriptome of a patient suffering from a particular disorder. ABN27253 to ABN59589 represent coligonucleotide sequences from rate, humans and mice, which are used in the exemplification of the present invention.

N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp. wipo.int/pub/published_pot_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                            New oligonucleotide libraries comprising oligonucleotides which selectively hybridize to mRNAs transcribed from a transcription unit of a genome, useful for detecting tissue-, pathology-, and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              transcription units that populate a genome. The library comprises several oligonucleotides, each capable of hybridising selectively to a set of messenger RNAs transcribed from a given transcription unit of the genome, which encodes one or more messenger RNA splice variants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      messenger RNAs that populate a (sub-)transcriptome, where the (sub-)transcriptome comprises messenger RNAs transcribed from multiple
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Neurogenin 3; Ngn3; chromosome 10q22.1-22.2; cellular differentiation; islet cell precursor identification; diabetes mellitus; human; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

The human neurogenin 3 Ngn3 DNA sequence AAC61089 encodes the Ngn3 protein AAY85617. The Ngn3 gene is located at chromosome position protein aavenue.

10422.1-212. The invention relates to the human Ngn3 nucleotide and protein sequences, and includes an antibody recognising the Ngn3 protein. Also included in the invention is a method for identifying an islet cell precursor, the method involves analysing a cell for the expression of the Ngn3 gene product, where detection of the product is indicative of an islet cell precursor. The Ngn3 DNA sequence is useful as a diagnostic reagent for detecting (in a subject) a predisposition to a defect in pancreatic islet cell function or formation associated with a defect in practicity. The Ngn3 protein is useful for identifying beta-cell precursor cells expressing Ngn3, and to alter cellular differentiation in culture in vivo to produce new beta-cells to treat patients with diabetes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

The invention relates to novel nucleic acids encoding novel human foetal antigens. The nucleic acids and proteins are used to prevent, treat (e.g. antigens. The nucleic acids and proteins are used to prevent, treat (e.g. rabbits, goats, horses, cats, dogs, chickens or sheep. They care also used in diagnosing a pathological condition or susceptibility to a pathological condition. The antibodies to the antigens can also conclude the alleviating symptoms associated with the disorders and in diagnostic immunosasays e.g. radioimmunoassays or enzyme linked immunosorbent assays (ELISA). Disorders which are diagnosed or treated immunosorbent assays (ELISA). Disorders which are diagnosed or treated conclude autoimmune diseases e.g. rheumatoid arthritis, cardiovascular disorders e.g. radial arrest, cerebrovascular disorders e.g. cardiac aused by bacteria, viruses and fungion sold out a disorders e.g. corneal intection asystem disorders e.g. corneal interview by preptices can also be used to ald wound healing and epithelial cell proliferation, to responsibilities, fat content, ilpid, protein, candorders e.g. crapablities, fat content, lipid, protein, candorders e.g. capablities, fat content, lipid, protein, cambohydrate, virusins, capanierals, cofactors and disorders treated by the nucleic acids and examples of diseases and disorders treated by the nucleic acids and proteins are given in the specification. The present sequence

The present invention relates to a method for determining the presence of neoplastic molecular markers in a host, involving the use of neoplastic molecular marker specific reagents to detect such markers and analysing the array of reagents, allowing the identification of the neoplastic disease present. This can be used to determine the best treatment for cancers, in particular neural cell, lung and prostate tumours. The present sequence is a pCR primer useful for detecting the coding sequences of markers of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           PCR primers AAV42515-16 are used to isolate part of the DNA encoding a basic helix-loop-helix (BHLH) type protein, designated RELAX (Rat Embryonic Longitudinal Axis) protein. The PCR product is termed CIG235. The protein is used to control and participate in gene expression, by acting as transcriptional activator, strictly dependent on the
                                                                      Determining the presence of neoplastic molecular markers, by identifying the presence of markers in host test sample using array of neoplastic molecular marker specific reagents and analyzing the array
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Basic helix-loop-helix; BHLH; RELAX; Rat Embryonic Longitudinal Axis; control; gene expression; transcriptional activator; targeting; protein expression; central nervous system; CNS; treatment; nervous system disorder; CIG235; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             - with

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           the present invention. The neurogenin nucleic acids can be expressed in a host cell, transformed using an expression vector, to produce recombinant proteins. The proteins and the antibodies raised against the proteins are useful in the study of neurogenesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The mouse neurogenin 1 is one of several neurogenin proteins discussed
                                                                                                                                                                            Gaps
presence of an intact E box (CANNTG), particularly for targeting expression of proteins to the central nervous system (CNS). The nucleic acid sequence came be used to treat nervous system disorders, and antisense sequences can be used to control mRNA transcription.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             neurogenins, useful in neurogenesis - and recombinant nucleic and proteins derived from rat and Xenopus

The patent discloses a method for inducing non-neuronal cells (NNC) to differentiate into neurons and for NNCs to express a neuronal subtype specific marker. Transformed host cells are used as sources of neuronal and other growth factors; in culture for screening compounds that modulate neural differentiation or as sources of recombinantly produced neuroganins and phox2a proteins for use in transplantation. The cells also have a variety of in vivo uses, e.g. for transplantation at sites of neuronal dysfunction e.g. patients with hearing or vision loss due to optical or auditory nerve damage, brain or spinal cord injuries, and neurodegenerative disorders e.g. Alzheimer's disease. The present sequence encodes murine neuroganin-1 (NGN-1), a transcription factor. NNCS differentiate into neurons through the recombinant expression of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  transcription factor that induces a core program of neurogenesis. Forced expression of murine NGNI can elicit expression of at least some neuronal phenotypic markers even in NNCs. This can be used in autografting.
                                                                                                                                                                                                                                                                                      Neurogenin-1; NGN-1; non-neuronal cell; NNC; neurogenesis; Phox2a protein; neuronal subtype-specific marker; growth factor; neurolal differentiation; transplantation; neuronal dysfunction; optical nerve damage; auditory nerve damage, neurodegenerative disorder; neuroprotective; nootropic; anticonvulsant; antiParkinsonlan; vulnerary; cerebroprotective; immunesuppressant; antilnfectious; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    non-neuronal cells to differentiate into neurons and for non-neuronal cells to express a neuronal subtype-specific marker, comprising contacting the non-neuronal cells with a vector containing neurogenin nucleic acid .

amino acid sequence, or any of its homologues or orthologues as therapeutic agents for the treatment of deafness, partial hearing loss, vestibular effects due to damage or loss of inner hair cells, osteoarthritis and abnormal cell proliferation. The invention also encompasses methods of screening for compounds which affect the expression of an atomal-associated nucleic acid sequence in an animal, and a transgenic animal in which an allele of a native atomal-associated gene is replaced by a heterologues nucleic acid sequence, thus inactivating the atomal-associated allele. The nucleic acids or proteins may be used in a method of treating an animal for hearing impairment, joint disease, balance disorders, abnormal cell proliferation, or other disease related to loss of a functional atomal-associated or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        protein. They may particularly be used to treat an animal with a deficiency in cerebellar granule neurons or their precursors, and may also be used in promoting mechanoreceptive cell growth and generating hair cells. The present sequence represents an atomal-associated nucleic acid sequence referred to in the invention.
                                                                                                                                                                                                    Atonal; homologue; orthologue; atonal-associated protein; deafness; hearing impairment; vestibular effect; balance disorder; osteoarthritis; cellular proliferation; cereblar granule neuron; gene therapy; mechanoreceptive cell growth; auditory; osteopathic; cytostatic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to the use of atonal-associated nucleic acid or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Therapeutic use of atonal-associated nucleic acids or amino acids, or any of its homologs or orthologs, for the treatment of e.g. deafness, osteoarthritis and abnormal cell proliferation -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Note: The present sequence is not shown in the specification, but was obtained from GenBank.

brain genomic DNA was isolated and partially digested
with a combination of EcoRI and EcoRI Methylase. Size
selected DNA was cloned into the pBACe3.6 vector at the
ECORI sites. The ligation products were transformed into
DH10B electrocompetent cells (BRL Life Technologies).
